Dr. Kamran Khan is an infectious disease physician and scientist at St. Michael's Hospital and an Associate Professor with the Division of Infectious Diseases at the University of Toronto. His clinical and research interests focus on international travel, global migration and the spread of infectious diseases. Dr. Khan's clinical practices in tuberculosis at St. Michael's Hospital and the University Health Network inspired a large ten year study to understand how well the current immigration health screening system in Canada can prevent the importation of active tuberculosis, and failing that, its early domestic detection. In this presentation he will describe the current system and key findings from a study of nearly one million new immigrants screened for tuberculosis prior to their arrival in Ontario.
